

STORAGE AND HANDLING

PRESERVING THE INTEGRITY AND SHELF LIFE OF YOUR LUBRICANTS

At Colfax Fluid Handling's Reliability Services, we understand lubrication maintenance is not as simple as just having the right lubricant on hand. It's also about what happens to that lubricant while waiting to be used.

The review of your existing storage and warehousing procedures is a critical part of our overall service offering. Lubrication specialists examine and assess how your lubricants are received, stored, maintained and dispensed, with the goal of helping you establish best practices in storage and handling.

The analysis of your storage procedures involves a number of dimensions. We'll examine whether you:

- Store lubricants inside or outside
- Follow an established process to manage incoming lubricants
- Provide proper identification of each lubricant
- Ensure strict adherence to date rotation
- Maintain clean, dry and cool storage facilities
- Sustain temperature levels to prevent degradation
- Leverage storage and handling best practices to prevent contamination

And that's just the beginning of the questions we ask. We'll also look at your operation's handling processes during the transfer of lubricants. What steps you take to keep lubricants pristine from the drum to the dispensing station. Whether you maintain filtration and dessicant breathers.

The outcome of this assessment can pave the way for a new approach to storage and handling, one that not only safeguards the quality of your lubricants but supports the overall reliability of your operation. And that's just part of the Reliability Services commitment to keep you Up and Running.
