

OIL ANALYSIS

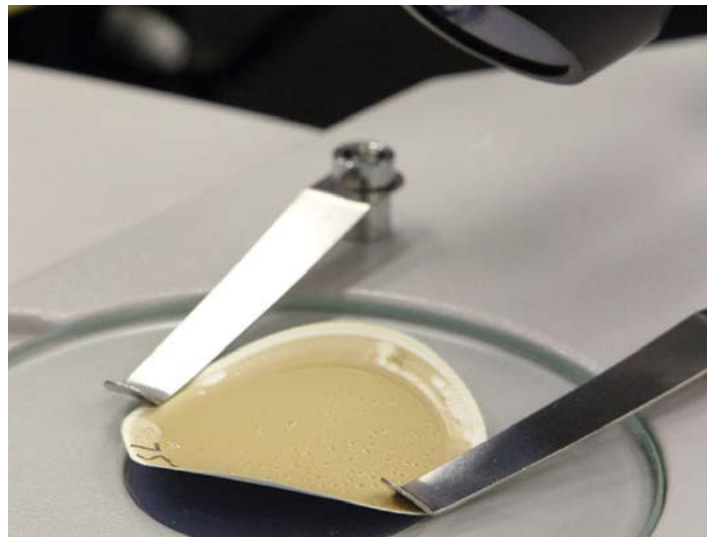

PREVENTIVE BEST PRACTICES TO KEEP YOUR EQUIPMENT AND FACILITY OPERATING AT PEAK PERFORMANCE

Oil analysis services from Colfax Fluid Handling's Reliability Services help keep your equipment in peak operating condition for ongoing reliable performance at your facility. Our lubrication specialists focus on the overall health of your oil, with an eye on potential contamination and machinery wear.

First, we talk with you about the machinery you use, the operating conditions at your facility and the type of lubricant you're using. Then, our experts draw samples, which we send to a third-party lab for analysis. Test results, often available within 24 hours, indicate any "red" flags, such as out-of-range viscosities or ISO codes, contamination, metal wear or if the additive package used is performing to specification.

These test results drive recommendations to ensure that lubricant ranges meet the OEM specs for each piece of equipment. We'll determine if cross-contamination is occurring, and prescribe preventive methods to prevent this machinery-destroying occurrence.

We can also make certain that you have the proper sampling ports, plus help to make sure that samples are drawn properly by your team as oil analysis continues. We'll help you establish a schedule to perform oil analysis – monthly, quarterly or even farther out – one that makes sense for every piece of equipment.

Analysis of your oil can even help extend the life of your equipment by giving us the information to recommend even cleaner ISO code lubricants, as well as to verify proper viscosities, operating temperatures and additive packages. While these may vary with each piece of equipment, best practices in oil analysis that we help you establish at your facility maintain production while reducing downtime and stretching capital budgets.
